

METAL STANDING ROOF GUTTER FRAME

1. Picture of the product

2. Product description

The metal standing roof gutter frame is made of 1.4 mm thick galvanised steel (zinc coating 350 g/m²). The length of one frame element is 3 m. The standing roof gutter frame is always attached to the underlying boarding at 200–300 mm intervals so that it is also fixed on each roof truss.

The metal frame is straight and easy to install. It also does not rot. The airy structure allows for the best possible drying of condensed water.
